With an emphasis on a scientific approach which includes analysing quantitative data, neuropsychology follows an information processing approach to brain activity using standard assessments to evaluate various mental functions. This book examines the standardized battery of tests in neuropsychology, with a particular focus on forensic applications of these tests, suggesting that a united theory of assessment needs to be established. Bringing together multiple articles related to forensic neuropsychology, this book offers an exploration of the neurological and psychometric theoretical basis for standardized batteries as well as a comparison between flexible and standardized batteries. This volume provides a rich resource for student, theorists, and empirical researchers in cognitive psychology, linguistics, and education; and teachers and clinicians who can use the research in their work.

fundamentals of human neuropsychology 6th edition: Thinking about Bribery Philip M. Nichols, Diana C. Robertson, 2017-09-07 Bribery is perhaps the most visible and most frequently studied form of corruption. Very little research, however, examines the individual decision to offer or accept a bribe, or how understanding that decision can help to effectively control bribery. This book brings together research by scholars from a variety of disciplines studying the mind and morality, who use their research to explain how and why decisions regarding participation in bribery are made. It first examines bribery from the perspective of brain structure, then approaches the decision to engage in bribery from a cognitive perspective. It examines the psychological costs imposed on a person who engages in bribery, and studies societal and organizational norms and their impact on bribery. This is an ideal read for scholars and other interested persons studying business ethics, bribery and corruption, corruption control, and the applications of neuroscience in a business environment.

fundamentals of human neuropsychology 6th edition: The Moral Landscape Sam Harris, 2011-06-30 Sam Harris's first book, The End of Faith, ignited a worldwide debate about the validity of religion. In the aftermath, Harris discovered that most people - from religious fundamentalists to nonbelieving scientists - agree on one point: science has nothing to say on the subject of human

values. Indeed, our failure to address questions of meaning and morality through science has now become the primary justification for religious faith. In this highly controversial book, Sam Harris seeks to link morality to the rest of human knowledge. Defining morality in terms of human and animal well-being, Harris argues that science can do more than tell how we are; it can, in principle, tell us how we ought to be. In his view, moral relativism is simply false - and comes at an increasing cost to humanity. And the intrusions of religion into the sphere of human values can be finally repelled: for just as there is no such thing as Christian physics or Muslim algebra, there can be no Christian or Muslim morality. Using his expertise in philosophy and neuroscience, along with his experience on the front lines of our 'culture wars', Harris delivers a game-changing book about the future of science and about the real basis of human cooperation.

fundamentals of human neuropsychology 6th edition: Juvenile Delinquency and Disability Kristin C. Thompson, Richard J. Morris, 2016-04-12 This book discusses the relationship between juvenile disability and delinquency, including characteristics of youth with disabilities, how disability relates to delinquency, and its impact during a youth's involvement with the juvenile justice system. The book details the relationship between developmental, cognitive, psychological, and educational disorders—specific conditions including ADHD, bipolar disorder, and autism spectrum disorder—and delinquency in light of both their overrepresentation among youth offenders and the uninformed handling of these youth within the court system. Case studies illustrate the complexities in the

processing and placement of these youth offenders, as well as highlight the barriers to delinquent youth receiving appropriate treatment, and their increased risk of reoffending. From this robust knowledge base, the authors make expert recommendations for improving the juvenile justice system at the practice and policy levels to better serve this population. This authoritative volume:

- Identifies characteristics and risk factors associated with juvenile delinquency.
- Reviews evidence relating developmental, mental health, and other disorders to juvenile offending.
- Describes the implications of disabilities in key areas such as offending, risk assessment, competency, and outcomes.
- Examines the role of disability law in the juvenile justice system.
- Offers guidelines for professionals to use this knowledge in their work.

Juvenile Delinquency and Disability is an essential resource for researchers, scientist-practitioners, and graduate students in clinical, counseling, and school psychology, criminology and criminal justice, child psychiatry, educational policy and politics, developmental psychology, and social work.

fundamentals of human neuropsychology 6th edition: Cannabinoid Modulation of Emotion, Memory, and Motivation Patrizia Campolongo, Liana Fattore, 2015-05-18 The endocannabinoid system consists of cannabinoid receptors, their endogenous lipid ligands (endocannabinoids) and the enzymatic machinery for their synthesis and degradation. In the brain, endocannabinoids regulate ion channel activity and neurotransmitter release and thereby contribute to various aspects of brain function, including memory, reward and emotions. Their ability to modulate synaptic efficacy has a wide range of functional consequences and provides unique therapeutic possibilities. Unprecedented advances have been made in the understanding of the role of endocannabinoids in the regulation of the emotional brain over the past few years. However, a comprehensive book encompassing all these aspects is still lacking. The book will provide an overview of the role played by the endocannabinoid system in the regulation of emotional processes with particular emphasis on the modulation of memory and reward for emotionally arousing events and for the regulation of motivational aspects in cannabis use.

fundamentals of human neuropsychology 6th edition: The Amygdala Barbara Ferry, 2012-12-19 Among the components of the limbic system, the amygdala is a fascinating structure that is involved in the processes of liking and disliking and in the ways our emotions drive our actions and affect the strength of our memories. Combined with new conceptual breakthroughs, the very latest data obtained by leading world experts in amygdala function that are reviewed in this book have helped to understand how the amygdala contribute to these processes and also to a variety of neurological and neuropsychiatric pathologies. Of course, due to the rate of research advancement, all the chapters presented here correspond to precise questions addressed by experts using highly specific techniques. Therefore, each chapter should be viewed as pieces of a puzzle that represent

all the different research areas that have to be taken into consideration in discussing the role of the amygdala in emotion and memory. Although the primary goal of this book is to inform experts and newcomers of some of the latest data in the field of brain structures involved in mechanisms underlying emotional learning and memory, we hope it will also help to stimulate discussion on the functional role of the amygdala and connected brain structures in these mechanisms.

fundamentals of human neuropsychology 6th edition: Empathy Vincenzo Auriemma, 2023-10-27 This book examines the concept of empathy in sociological and neuroscientific discourses using innovative perspectives from sociology and social neuroscience. Through a transdisciplinary approach, the author delves into the history of empathy and its social, cultural and semantic changes, and then reviews the conception of empathy in neuroscientific discourse. Distancing itself from the traditional neuroscientific literature of biological universalism, this volume offers an innovative perspective on empathy. It also opens a new avenue for neurosociology, which is presented as the discipline that can emphasize all the cultural and emotional aspects that govern empathy. Key themes addressed in the text are: empathy in all its meanings, from Hume to TenHouten; neurosociology as one possible avenue for embracing the cultural and neuroscientific aspects of empathy; and empirical research. A valuable resource for sociology students and academics in the field of empathy and neurosociology, this book is also of interest to those studying sociological thought, and social neuroscience.
